

In the more than 26 years since establishment, Lasertec B.V. is a well-known name in the field of Laser micromachining. At Lasertec, the client is attuned to the correct wavelength for all sorts of engraving at a favorable price/quality ratio and correct delivery terms. Thanks to a high level of knowledge, innovative powers and hi-tech equipment, Lasertec also has strategic and technological collaborations with R&D departments.

Lasertec combines ps and fs laser with state of the art measurement and control technology. This combination makes it possible to deploy these processes for large-scale production, these processes where until recently only possible on laboratory scale.

All machining stations have inline measurement and control facilities, so a very high yield is guaranteed.

In addition to these extensive machinery Lasertec B.V. has a dedicated team of staff. The rapidly growing team consists of members with a scientific background as well as people with experience in industrial production. We have our own software engineers to deal with every challenge in the motion control or process monitoring.

Lasertec can use the technical capabilities to push the boundaries of what is possible, or we can use technology to set up a highly efficient large scale production. In most cases Lasertec is involved directly after the customer has defined a functional model of the new product. Together with the customer we unroll the serial production in our facility.
