

YOUR PARTNER IN PRECISION TECHNOLOGY

About Renishaw

Renishaw is a global, high precision metrology and healthcare technology group. We design, manufacture and deliver solutions and systems that provide unparalleled precision, control and reliability in the transport sector, agricultural branch, electronics and healthcare. Precision metrology products are divided into two main groups: Metrology and Position and Motion Control.

Precision measurement and process control

Our metrology products help manufacturers to maximise production output, reduce significantly the time taken to produce and inspect components, and to keep their machines running reliably. Probes are one of the most well-known and most used Renishaw products in the industry.

Apply innovation

Our company was established in 1973 by Sir David McMurtry. He is the inventor of Renishaw's first product, the touch-trigger probe which product led to a revolution in three-dimensional co-ordinate measurement. Of course in the future Renishaw will continue to apply innovation in the most broadest sense of the word.

Position and motion control

Renishaw offers a wide range of high speed, absolute and incremental, linear and rotary encoder systems to meet the diverse requirements of industrial automation. Divided into three main groups, our optical, magnetic and laser systems are designed to provide the perfect solution depending on for example environment and space availability. A solution for every motion.
